```
   ;; if this context has a process associated with it, and the process is currently stuck waiting for input, unstick it so that it can look around and
   ;; (presumably) notice some important change in its environment. This is also called when someone in another process, such as a command menu
   ;; or a window menu operation, wants to tell the command process to execute the command. Note that under a few circumstances this function will
   ;; be called by a running command in the sedit process. For example, the complete-and-close command calls il:closew which calls sedit's closefn
   ;; which tries to wake up the sedit to let it know the window was closed. In this case, awake-command-porcess will result in a no-op because sedit
   ;; has a command running, and therefore cannot be woken up. COMMAND is a command form which will be used as the value returned from
   ;; GETKEY in SEDIT1. COMMAND should be of the form (<fn> <normalize?> <extra args>), so that <fn> will be applied to the context, the
   ;; charcode invoking the command (NIL in this case), and the extra args. After the command runs the window will scroll to normalize the caret if
   ;; <normalize?> is T. If COMMAND is NIL then the SEdit will just update the window.

```

;;; When a managed object is changed, we must check if we have an open edit on it. If so, calling SEdit again, with the fresh definition, will force the
;;; update. This is fairly tricky, though. Markaschanged is called as a result of editing a managed definition, so this markaschangedfn could be running
;;; in the sedit process under the completion-fn half way through completion. IDEALLY in this case we could say "i know it changed, i just changed it!"
;;; and ignore this call. BUT FOR NOW (1/14/91) since the manager can change the definition on completion (editdates, for one), we have to notify
;;; SEdit. Since calling editdef will restart the sedit process, the completion-fn will not finish, so do the verify-structure here.

  (IL:LAMBDA (EXPR COMS ATOM TYPE IFCHANGEDFN OPTIONS)   ; Edited 10-Jul-91 19:04 by jds

;;; Convert call to EDITE into sedit format (structure props options). The completion-fn is determined based on TYPE, since the file manager isn't very
;;; consistent about IL:PROPLST and IL:ALIST. Since EDITE is supposed to wait for completion, create a completion event which is notified by the
;;; completion-fn. Also, if the top cons is changed, try to smash the completed structure into EXPR to provide eqness.

;;; IDEALLY: this whole mess wouldn't exist- if il:putdef could handle il:proplst, etc, then completion could simply call putdef, not special case as it does
;;; here.

```
    (LET* ((EVENT (IL:CREATE.EVENT "SEDITE Completion"))
