# REMOTEPSW

By:  Christopher Lane (Lane@Sumex-Aim.Stanford.Edu)

Uses:  COURIERSERVE, COURIERDEFS

REMOTEPSW defines a *remote* process status window facility that runs on top of Courier.  The remote process status window is identical to the local one except that it contains **UPDATE** (to get the current process status) instead of **BREAK**, and **INFO** is not implemented.  Both the client and server code are contained in the module which must be loaded on both hosts.  The Courier server must be running on the host you wish to monitor.

The only user function is:

(REMOTE.PROCESS.STATUS.WINDOW *HOST*)                                                    [Function]

which opens a remote process status window onto *HOST*, where *HOST* is any NS host specification that COURIER.OPEN accepts.
