
WHICHKEY

By Ron Kaplan

This document was last edited in October 2025.

This file defines two trival functions, WHICHKEY and DOWNP.

(WHICHKEY *DELAY*)

[Function]

WHICHKEY returns a pair (keynumber keyname) corresponding to the first key in the keyboard transition table that is down after *DELAY* milliseconds have expired. The *DELAY* gives the user time to find and depress the key after typing in the WHICHKEY expression in an exec. *DELAY* defaults to 3000. WHICHKEY returns NIL if no key is down after *DELAY* milliseconds.

(DOWNP *KEYNAME DELAY*)

[Function]

Returns T if key *KEYNAME* is down after *DELAY* milliseconds.

Only the source file for WHICHKEY is provided, there is no compiled file.
