Welcome to the Rooms Introduction.

This is a suite of rooms which describe the Rooms system itself. Each room introduces certain topics, and where appropriate provides exercises to let you experience the things described ("put some meat on the bones").

The collection of buttons at the right can be used to move through the exhibits. Following the screen buttons labelled "Next" in each room will provide a step-by-step introduction to the basics of Rooms. This is recommended as the best way to get started. Start by selecting the Next screen button with the left mouse button.

```

:TITLE "The Rooms Model" :STRING "
```

Rooms provides many screens worth of working space for the Xerox LISP user.

Each space is called a "room", has a name, and contains a collection of windows.

Windows can be in one or more rooms. A window in more than one room is referred to as "shared".

A window may have a different position and shape in each room. The collection of this information is called the "placement" of the window in that room.

In certain situations, it is desirable to use the same configuration of windows in more than one room. For example, in these introductory rooms, the navigation buttons, the promptwindow, and the EXEC window act as a common framework for each room's specific information windows. In these situations, a room containing only the common windows is created (here it is called "Intro Panel") and this room is "included" in the other rooms.

Exercise: The "Intro Panel" button is an easy way to go to the "Intro Panel". Use it to go to that room, and notice the set of windows which is common. Then return to this room, using the inverted button at the center of the screen below (a "back door").

So a room has (at least):

- a name
- a set of placements for various windows
- a set of inclusions of other rooms.

```

:TITLE "Doors" :STRING "
```

The various buttons which you have been using to move about in this exploratorium are called "doors".

Doors can be of various different shapes. To the right you will find a number of those shapes, all of which will take you to this very room.

Doors can be created using the background menu: select the "Rooms>Make Door" command. (This X>Y notation is used to denote the Y subcommand of the X command of a menu.) You will be prompted with a menu of room names to select a destination for the door; then you will be prompted with a menu of door shapes for the shape of the door. A door will be created, and you will be permitted to move it into the position you would like.

Exercise: Create a door to this room, looking like a porthole. Then go through it to this room.

Doors are windows. You can therefore get rid of them by closing the window.

Exercise: Close the doors you just created.

```
" :FONT *INTRO-NOTE-FONT* :READ-ONLY? NIL)

:TITLE "The Overview" :STRING "
```

The Overview provides a number of different operations. Roughly these can be grouped into: room selection, room manipulation, room structure viewing.

All operations in the Overview are invoked in same way:

- . the operation is selected by depressing and holding down a mode key on the keyboard,
- . the object to be operated on selected by pointing and clicking:
 - a room: middle mouse button; or
 - a placement: left mouse button.

The various operations are represented by screen buttons at the bottom of the screen. These are inverted to indicate the operation which is currently selected.

Exercise: Use the GO TO operation to return to this room:

```
goto the overview;
select the GO TO operation (space bar);
return to this room by selecting its pictogram with the middle mouse button.
```

Exercise: Use the Move operation on a placement:

```
goto the overview;
find the placement for this window;
select the MOVE operation (MOVE key);
move this placement around in this room;
return to this room when you are done.
```

Exercise: Explore the other Overview commands. Return to this room when you are done.

```
" :FONT *INTRO-NOTE-FONT* :READ-ONLY? NIL)
(:WINDOW 13 :TYPE :BUTTON :TEXT "Next >" :ACTION (INTERACTIVE-GO-TO-ROOM-NAMED "Intro Backgrounds")
:HELP "Go to the next room in the Introduction" :SHADOWS T :TYPE :STRETCHY-ARK)
(:WINDOW 14 :TYPE :NOTE-WINDOW :REGION (1/32 227/808 261/512 503/808)
:TITLE "Background Menu" :STRING "
```

So that commands to manipulate the Rooms system are always ready-at-hand, they are made available on the background menu, under the \"Rooms\" item.

Menus are used for prompting in the interactions invoked by some of these commands. Selecting outside any of these menus indicates that you do not want to issue the command after all (you are \"cancelling\" or \"aborting\" the command).

Exercise: Go to the \"Intro Doors\" room using the \"Rooms>Go to Room\" background command. Return here.

Exercise: Go to the Overview using the \"Rooms\" background command. Return here.

To make it quicker to issue these commands , Rooms provides a way of getting a screen button (an accelerator) for any command appearing on the background menu. Hold down the COPY (or SHIFT) key when selecting the command from the menu. Instead of the command being invoked, a button which will invoke the command will be created.

Exercise: Create an accelerator for the \"Rooms>Go to Room\" background command. (It will be labelled \"Go to Room\", like the one you see at right.)

```
" :FONT *INTRO-NOTE-FONT* :READ-ONLY? NIL)
(:WINDOW 15 :TYPE :BUTTON :TEXT "Next >" :ACTION (INTERACTIVE-GO-TO-ROOM-NAMED "Intro End")
:HELP "Go to the next room in the Introduction" :SHADOWS T :TYPE :STRETCHY-ARK)
(:WINDOW 16 :TYPE :NOTE-WINDOW :REGION (1/64 49/808 379/1024 691/808)
:TITLE "Backgrounds" :STRING "
```

Each room has a background specification telling how to paint its background. The specification is an ordered list of commands.

The three commands available are:

```
(:TEXT <string> &KEY :FONT :SHADOWS :POSITION :ALIGNMENT)
(:REGION <region> &KEY :SHADE :BORDER :BORDER-SHADE)
(:WHOLE-SCREEN <shade> &KEY :BORDER :BORDER-SHADE)
```

The use of these commands is best illustrated by example.

Exercise: Select the \"Edit This Room\" button in the top middle of the screen using the left or middle button. This opens an SEdit window with this room's description.

As you can see, the background specification for a room can be very complex allowing great flexibility in customizing the way the background is painted.

The functions il:getregion, il:getposition, and il:editshade can be used to get regions, positions and shades interactively. For example, to insert a region in SEdit, type (il:getregion) followed by M-Z EVAL (mutate selection by EVAL).

Exercise: change some of the regions, positions and shades in this rooms background specification.

```
