Running AR Test Cases & Recording the Results

The Pass and Fail commands

The "Pass" and "Fail" commands are defined on <Lispcore>Internal>Library>RELEASETOOLS. The form of use is

Pass *AR#1 AR#2 AR#3* . . .;Records the fact that AR Test Cases for the ARs named were run and succeeded.

Fail *AR#4 AR#5 AR#6* . . . ; Records the fact that AR Test Cases for the ARs named were run and failed.

These two commands record each AR in a log file, along with your user name (so we know who ran it), and the current time (so we know when). These log entries will be used to

1) Track the current status of the AR test cases, and
2) Prepare the alpha-test log for Beta-test readiness review.

Running a test

When you run an AR test case, please use the Pass or Fail command to record the fact!
